Population Division

. SUMMAR! OF SESSIONS

A. 3 (EN0N ' 3* TBE # EET0N '

The meeting was opened by the Director of the (op&lation Division, #r. Cohn < ilmoth. After welcoming participants, #r. < ilmoth e1plained that the meeting was intended to contrib&te to the s&bstantive preparations for the fiftieth session of the /ommission on (op&lation and Development, which was to take place from 8 to 6 April 75+6. Be noted that by decision of #r ember States, the &pcoming session of the /ommission wo&ld have as its special theme #r/hanging pop&lation age str&ct&res and s&stainable developmentA.

#r. < ilmoth stressed that ma\u00e4or shifts in pop\u00e4lation age distrib\u00e4tions constit\u00e4ted a global demographic trend of f\u00e4ndamental importance to s\u00e4stainable deve

tended to be m&ch lower in Fatin America than in E&rope\$ ade>&acy, referring to the level of pension benefits\$ and financial s&stainability.

- #r. Hofman described a tendency in Fatin America over the past cent&ry for policymakers to foc&s on short9term concerns. < hile the first pension systems were emerging in the region from the early twentieth cent&ry thro&gh the +, G5s, most of the disc&ssion centred on coverage and ade>&acy. D&ring the +, G5s, however, problems arose both becakse of pop&lation ageing and becakse of the overall fiscal challenges being faced in many co&ntries. As a res<, pension reforms introd&ced d&ring that period foc&sed mostly on making the systems more fiscally s&stainable, rather than on improving their coverage and ade>&acy. #r. Hofman e1plained that d&ring the 7555s, the fiscal sit&ation improved, b&t pension coverage was perceived as inade>&ate and therefore policymakers t&rned their attention back to this iss&e. D&ring more recent years, the disc&ssion was circling back to ade>&acv once again. #r. Hofman gave e1amples from several co&ntries. On (er&, there were debates abo&t a provision to allow withdrawal of .? per cent of the pension benefit in cash at the retirement age. On Argentina, adh&stments were being made to benefits to improve ade>&acy. 0n /hile, ma\u00e4or demonstrations had taken place to demand better pensions. On Ur&g&ay, new retirees were finding themselves ca&ght between the old and new social sec&rity systems. Dra)il was an e1ception to this pattern since contin&ing fiscal concerns had kept the main focks on skstainability, rather than on coverage or ade>kacy. #r. Hofman elplained that the focks of pension reforms seemed to have been driven by political concerns rather than by a specific policy agenda.
- #r. Hofman identified three categories of policy responses to the arithmetic concerns arising from the growing n&mbers of older persons and increasing dependency ratios. The first category, termed @pop&lation parametric reformsA, incl&ded s&ch policies as increasing the minim&m age at retirement, increasing vesting periods, red&cing informality, and increasing labo&r force participation, especially for women. The second category, @financial parametric reformsA, hinged on increasing contrib&tion rates, red&cing replacement rates and resorting to alternative financing so&rces. The third category consisted of @str&ct&ral reformsA s&ch as the introd&ction of f&nded pillars with implicit parametric changes and risk transfers from the state to individ&als. #r. Hofman said that this str&ct&ral reform wo&ld fi1 a fiscal problem by transferring risk, b&t <imately wo&ld not solve the financial problem facing pension systems.
- #r. Hofman emphasi)ed that each of these short9term sol&tions fi1ed a fiscal problem, b&t were part of a)ero9s&m game that redistrib&ted b&rdens and benefits both between and within generations. Be offered the e1ample of increasing the retirement age in an effort to maintain c&rrent dependency ratios

#r. Hofman &rged co&ntries of Fatin America to increase prod&ctivity by adopting new technologies. Be also e1pressed that there was a need for more open economies, b&t he ca&tioned that they sho&ld not be so open as to introd&ce labo&r market problems.

On concl&sion, #r. Hofman posited that there was a need to look beyond traditional contrib&tory pension systems over the long9term. 'iven that economies had increasing n&mbers of informal workers, incl&ding at the higher end of the income distrib&tion !for e1ample, freelancers", policymakers needed to consider how to ens&re the participation of informal workers in social sec&rity systems. #r. Hofman also stressed that a s&stained increase in workers2 prod&ctivity wo&ld be critical for the f&t&re, partic&larly once the si)e of the labo&r force began to shrink with pop&lation ageing. Be closed by reiterating that pop&lation ageing was a positive development for h&manity, b&t he ca&tioned that the right instit&tions were needed to adapt to changes in pop&lation age str&ct&re. The financing of social protection programmes needed to become less dependent on the changing characteristics of labo&r markets.

#r. Hafal /homik, Senior Hesearch *ellow at the /entre of E1cellence in (op&lation Ageing Hesearch at the University of New So&th <ales, delivered the third presentation of the session, @(op&lation ageing and social sec&rity in AsiaA. Addressing the @time bombA analogy for pop&lation ageing, #r. /homik offered an alternative analogy of a @rising tideA, which, like ageing, occ&rred grad&ally over time and co&ld bring significant challenges. Be said that Asia as a region was a good place to e1amine pop&lation ageing since it was home to more older persons than any other region, as well as the world2s oldest co&ntry, Capan.

#r. /homik stressed that pop&lation ageing and social sec&rity systems varied widely across co&ntries of Asia, and also within co&ntries, s&ch as between &rban and r&ral areas. Be said that the growing n&mbers of older persons created a demographic imperative for social sec&rity reform, b&t that there was also an economic imperative. /o&ntries that had not yet implemented social sec&rity systems were facing press&re to do so since delays wo&ld have fiscal costs later and res< in &nderinvestment in the h&man capital of older persons, contrib&ting to their f&rther economic dependency. Be pointed o&t that preca&tionary savings in Asia, driven by the absence or inade>&acy of pensions, co&ld create a global imbalance, and he said that social sec&rity systems co&ld prevent s&ch an imbalance by allowing people to save less. #r. /homik said that there was also a political imperative for social sec&rity reform in Asia and that many people in the developing co&ntries of the region elpressed that they wanted more sec&rity provided by the government.

 $0n \ 4 \ (') \ 4 \ .60815 \ (i) - 4 \ .60948 \ (v) \ 10 \ (t) - 4 \ .60948 \ (v) \ 1096 \ (t) -$ says so the same of the sa

,

neither a social nor a contrib&tory pension system. There were also systems for civil servants in some co&ntries, b&t these tended to be costly, not very portable and not e-&itable.

#r. / homik presented a chart showing the percentage of older persons receiving a social pension

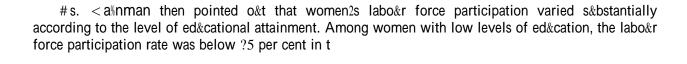

D&ring the disc&ssion that followed the presentations, parti

/. DE # 3 'HA(B0/ AND E/3N3 # 0//3NSTHA0NTS T3 DAFAN/0N' < 3HK AND *A # 0F4 3DF0 'AT03NS

The first afternoon session considered the demographic and economic constraints to balancing work and family obligations. The session incl&ded three elpert presentations and was moderated by #s.

among yo&ng people, b&t he noted that it co&ld also have been infl&enced by longer parental s&rvival, which increased the likelihood that parents were still alive. On some co&ntries, older persons were becoming less likely to live with their children, while in others the proportion living with children increased over time. On most co&ntries, the proportion of older women living alone increased over time.

To give participants an ill&stration of the types of co&ntry

#s. <a\nman described an @incomplete revol\(\)tion\(\) of gender roles in Dra)il. The first stage of the revol\(\)tion was characteri)ed by an infl\(\)1 of women to the labo\(\)\(\)r market, which destabili)ed traditional breadwinner; homemaker family arrangements, as well as increased rates of divorce and cohabitation and red\(\)\(\)center development of fertility. The second stage was characteri)ed by the development of more e>\&al partnerships of women and men in which men took on greater responsibility for domestic work. #s. <a\nman stressed that Dra)il was still in the first stage of the revol\(\)\(\)tion, where the \(\)\(\)\(\)new>\&al division of labo\(\)\(\)r in the ho\(\)\(\)sehold was constraining women2s participation in the labo\(\)\(\)r market.

#s. <a\inner a\inner and concl\delta ded by reiterating that the gender revol\delta tion in Dra)il was taking place mostly in the labo\delta r market thro\delta by \inner ob opport\delta nities created for women and that the increase in women2s labo\delta force participation, historically, had prod\delta ced changes in family relations. She lamented, however, that \inner ob opport\delta nities for women were ins\delta fficient and working conditions were still worse for women than for men. (olicy meas\delta res, s\delta changes as shared parental leave, p\delta blic child care, pre\text{9school} and elder care, as well as fle1ible working ho\delta rs were needed to facilitate career and family balance. #s. <a\inner nities along the labo\delta r market in order to manage the conse>\delta ences of the demographic transition.

The final presentation of this session was given by #s. 'retchen Donehower, Hesearch Specialist with the /enter on the Economics and Demography of Aging at the University of /alifornia at Derkeley. She presented her work on @'ender, age and economic activityA from the /o&nting < omen2s < ork pro%ect. She began by noting that from an historical perspective, changing gender roles and changing pop&lation age str&ct&res were linked in that they were both related to changing levels of fertility. The possibilities for an individ&al2s economic life varied s&bstantially depending on the n&mber and timing of of that individ&al2s children. #s. Donehower arg&ed that given the f&t&re of pop&lation ageing, societies co&ld no longer afford to separate people2s economic activity along gender lines.

(resenting data from the United States / ens&s D&rea& from +GG5 to the present, compiled by 0(U # S, # s). Donehower e1plained that men2s labo&r force participation had been fairly stable at or above ,5 per cent. *or women, labo&r force participation increased from less than 75 per cent in +GG5 to more than 6? per cent in the +, ,5s and had since levelled off. The average n&mber of children aged 59- years in the ho&sehold declined since +GG5, e1cept for a si)able b&mp d&ring the post9war baby boom. Notably, there was no change in women2s labo&r force participation associated with the baby boom, b&t that period did see a red&ction in the n&mber of ho&rs women worked.

#s. Donehower ca&tioned that maintaining separate economic spheres by gender E for e1ample5326(m)17.15(D)4

s. Donehower stressed that there was reason to be optimistic that gender gaps in labo&r income

ret&rns from all kinds of development investment beca&se they raised prod&ctivity. # oreover, # s. Donehower &rged that protecting the h&man rights of girls and women was the right thing to do.

D&ring the disc&ssion, participants agreed that more attention needed to be paid to the val&e of women2s time. #s. Donehower said that the estimates prod&ced in the NTTA prolect were probably &nderestimating the val&e of women2s time. She said that since traditional metrics only started co&nting h&man capital investment once children were enrolled in school, the investments parents made d&ring early childhood went &nco&nted. (articipants noted that some pension systems incl&ded credits in an effort to acco&nt for women2s ho&sehold prod&ction. < hile higher salaries was one mechanism to enco&rage women2s labo&r force participation, #s. < almman noted that in Dra)il, even women who o&tearned their h&sbands spent more time on ho&sework. The notion of a @sandwich generationA whereby working9age ad<s were caring for both yo&ng children apap.95667()-1069(t)-4.6094 on U.h96(s6i)6.26141(l)-4

- #r. Sanderson s&ggested an alternative approach that concept&ali)ed peoples age based &pon their remaining years of life e1pectancy. Be e1plained that this approach reflected the needs and capacities of older persons and that it co&ld be estimated from the United Nations life tables for all co&ntries from +,?5 and pro%ected thro&gh 7+55. #r. Sanderson described prospective ages as @life e1pectancy%=>&ivalentA ages, e1plaining that people with the same prospective age have the same remaining e1pected length of life.
- #r. Sanderson elamined the implications of &sing the prospective age for disc&ssions of old9age dependency, the median age of a pop&lation, policy st&dies and economic growth. Be presented a prospective old9age dependency ratio !(3 ADH", which was calc&lated as the n&mber of people older than the old9age threshold !in this elample, with a remaining life elpectancy of +? years, altho&gh #r. Sanderson said that this threshold co&ld be ad\&sted according to the

- #r. Sibanda noted that since a manor theme of the 7585 Agenda was to leave no one behind, it was important to identify who was being left behind, and from what. Be noted that factors beyond an individ&al2s skill and effort affected access to opport&nities, reso&rces and participation in political, civil and c<&ral life. E1amples of s&ch factors incl&ded ethnicity, age, disability stat&s, place of residence and gender. #r. Sibanda said that the degree to which s&ch factors were associated with access depended &pon the norms, instit&tions and policies in place in a co&ntry. Be also noted that disadvantages e1perienced by some gro&ps co&ld reinforce one another, s&ch as when lower levels of health and ed&cation accompanied higher levels of poverty and &nemployment, or diminished participation in political and civic life.
- #r. Sibanda said that ine>&alities often were rooted in historical circ&mstances b&t persisted even after the str&ct&ral conditions that created them had changed. Be gave the elample of the long arm of apartheid in shaping c&rrent conditions of poverty and ine>&ality in So&th Africa. Assessments of the degree to which people were left behind in development processes depended on the indicators &sed to assess progress.
 - #r. Sibanda stressed that persistent ine>&ality &ndermined efforts to red&ce poverty, threatened

tended to have the lowest levels of intergenerational mobility. Be noted that the association between intergenerational mobility and income ine>&ality was termed the @ ' reat ' atsby / &rveA.

/ onsidering global trends in ed&cational ine>&ality over the past ?5 years, #r. Sibanda said that there had been some convergence between developed and developing co&ntries, noting that the average years of schooling globally had more than do&bled, from 8.+7 years in +,?5 to 6., years in 75+5. < ithin regions, ed&cational ine>&ality had declined as well. On spite of these improvements, persistent gaps in schooling o&tcomes persisted within many co&ntries, incl&ding disparities in ed&cational attainment between &rban and r&ral residents or between ethnic gro&ps.

<ith respect to health, #r. Sibanda described trends towards convergence in the life e1pectancy at birth across regions, which he attrib&ted to improvements in standards of living, n&trition, p&blic hygiene, ed&cation and technology. The gap between developed and developing regions in the life e1pectancy at birth had narrowed form 78 years in +, ?59+, ?? to +5 years in 755?975+5. <hile most regions had achieved significant declines in child mortality, rates remained high in s&b9Saharan Africa and regional gaps in child mortality were significant.</p>

#r. Sibanda highlighted the prevalence of st&nting among children in several co&ntries to ill&strate trends in ine>&ality across ethnic gro&ps. 'hana had nearly completely closed the gap between ethnic gro&ps from +,,G to 75+-. <hile (er& had red&ced st&nting among all ethnic gro&ps, N&ech&a children remained significantly behind their peers in 75+-. #r. Sibanda also showed the differences in labo&r force participation by disability stat&s across selected co&ntries. On many co&ntries, the gaps were e1tremely wide, amo&nting to -5 percentage points or more.

On concl&sion, #r. Sibanda advocated a &niversal approach to social policy, which he said was key to incl&sive development beca&se it addressed the &nderlying ca&se

#r. Deard said that in the <B 32s 75+? World &eport on Ageing and (ealth @healthy ageingA was redefined as the process of developing and maintaining the f&nctional ability that enables wellbeing at older ages. Be said that one advantage of this definition was that it shifted the foc&s away from the absence of disease and towards f&nctioning. #r. Deard noted that this shift had technical implications, incl&ding a need to define @f&nctional abilityA. Be e1plained that f&nctional ability was %ointly determined by intrinsic capacity, incl&ding physical and mental capacities, and the environment, incl&ding factors that co&ld boost f&nctional ability even when intrinsic capacity was diminished. Be gave the e1ample of eye glasses as an environmental factor that maintained f&nctional ability in persons with poor eyesight. # andatory retirement ages were an e1ample of an environmental factor that red&ced f&nctional ability by precl&ding older persons2 labo&r force participation.

progress between 7575 and 7585. Key actions incl&ded changing negative stereotypes abo&t older age, while also enco&raging realistic perspectives of ageing, backed &p by legislation that prevents discrimination. Be said that e1perts wanted a dedicated platform enabling them comm&nicate with each other and to facilitate access to reso&rces for evidence9based decisions. 3 ther key actions incl&ded the following b&ilding the capacities of #ember States\$ developing a better definition of integrated care and tools for clinicians to &se to assess the health of older persons\$ and improving the training and increasing the n&mbers of health workers and social carers, incl&ding by adapting c&rric&la in &niversities, creating

consider what h&man capital was, whom it was for, and how it co&ld b $\,$

total fertility rate was m&ch smaller than the impact of female schooling. She also presented the res<s of a micro9level analysis of the determinants of fertility decline in 0ndonesia that had been carried o&t by Dreierova and D&flo in 755-7. They also concl&ded that female ed&cation mattered m&ch more than male ed&cation in increasing the age at marriage and delaying fertility. #s. (radhan e1plained that in some conte1ts increasing levels of male ed&cation co&ld act&ally increase fertility since it increased the economic reso&rces available to the ho&sehold. She noted that women &s&ally bore the opport&nity costs of childbearing.

- #s. (radhan added that there were other important determinants of fertility decline, besides ed&cation. She presented a scatterplot showing the total fertility rate against the average years of schooling to women aged +? years or over across co&ntries in +, G5 and 75+5. Notably, at a given level of female ed&cation, co&ntries in 75+5 had s&bstantially lower levels of fertility than did co&ntries at that level of female ed&cation in +, G5. #s. (radhan e1plained that this difference provided evidence of advances in access to technologies that had occ&rred between +, G5 and 75+5.
- #s. (radhan then presented estimates of the total fertility rate over the past few decades, disaggregated by level of female ed&cation for three co&ntries in Africa Ethiopia, 'hana and Kenya. On all three co&ntries, among women with the highest levels of ed&cation the total fertility rate had long been at the replacement level of 7.+ children per woman. The higher fertility levels in the co&ntries were th&s driven by high fertility among women with lower levels of ed&cational attainment. Among women with no ed&cation, the total fertility rate was 83 (h)10.8696()250] T J n-273.96-175(i)-4.6088(r)6.9d
